

Sergei Abrashkin

Frontend Developer (Pixi, React, TypeScript)

Tbilisi, Georgia (UTC+4) · Remote · B2B / contractor

+995 555 907 417 (WhatsApp) · sergeiuniverse@gmail.com · t.me/txrse · linkedin.com/in/sergeiabrashkin

Frontend developer (React, TypeScript) with 5 years in commercial development. Built enterprise-scale products in retail and logistics: architecture design from scratch, production launch, further evolution and support. Since 2026 — web game development on PixiJS: a slot game client with a server-authoritative round model, Spine 2D and WebSocket transport (independent project). Experienced in leading a frontend team of up to 6 developers, establishing testing and monitoring processes, and delivering business-critical systems.

SKILLS

Core: JavaScript (ES3–ES6+), TypeScript, React (18, 19), HTML, CSS

Game development: PixiJS 8, Spine 2D, WebSocket (partysocket), FSM, Inversify DI

State management: Zustand, Redux Toolkit, Redux, MobX

Data & API: TanStack Query, Axios, GraphQL, REST API

UI & visualization: MUI, SASS, Styled Components, Tailwind CSS, mapbox-gl, ECharts, react-virtuoso, dnd-kit, TanStack Table / Virtual, Framer Motion, Swiper

Forms & validation: React Hook Form, Zod, Yup, React Final Form

Testing & code quality: Vitest, Testing Library, MSW, jsdom, Storybook, ESLint, Husky

Monitoring & infrastructure: Sentry, OpenTelemetry, Vite, Keycloak, GitLab CI (basic pipeline configuration), Git Flow

AI tooling: Claude Code, Codex, GitHub Copilot — routine task automation and code-review assistance

EXPERIENCE

Independent project

Jul 2026 — present

Self-initiated project; source code and demo available on request.

Game Client Developer — Slot game client (PixiJS)

Jul 2026 — present

A web slot-machine client built to production-client conventions: outcomes are server-authoritative — the client renders round results and computes nothing.

- Designed a layered architecture (WebSocket transport, round state machine, MobX stores, PIXI controllers, Spine) with one-directional dependencies enforced by ESLint; wired through Inversify DI with two lifetimes (application / game mount) and ordered teardown.
- Implemented the WebSocket transport with a SignalR-style envelope: request/response correlation, zod validation of every message, timeouts, reconnect, cancellation via AbortSignal propagated through network calls, animations and game pauses.
- Built the round as a finite state machine with idle, spinning and result phases: network request and reel spin run in parallel; a server error rolls back the bet.
- Implemented frame-rate-independent reel mechanics on the game ticker: continuous symbol strip with wrap-around, landing plan (cruise, linear braking, overshoot easing) aligned to cell boundaries, staggered reel stop.
- Built the win presentation for 10 configurable paylines (1–10 active by game mode) with Spine symbol animations and win frames; Spine 2D integrated through an instance pool (warm-up, full state reset on release) — removed GC spikes from per-symbol skeleton creation.
- Mocked server behaviour with MSW WebSocket handlers reproducing the protocol (init, spin, balance, payline detection by payable, error path) — the client runs against a real backend without changes; two-level error handling (recoverable / fatal) including WebGL context loss.

Stack: PixiJS 8, Spine (spine-pixi-v8), TypeScript, MobX, Inversify, zod, MSW, React 19, Vite, ESLint

X5 Tech

Mar 2023 — May 2026

Technology company of X5 Group, a food retail group with 30,000+ stores and 80+ distribution centers.

Senior Frontend Developer / Frontend Lead — Supplier Personal Account

Oct 2024 — May 2026

A B2B platform where X5 suppliers create personalized advertising campaigns; campaign reach — a multi-million shopper audience.

- Developed and launched the product from scratch, reaching MVP within the first year of development.
- Exceeded the first-year supplier-onboarding OKR (~60 suppliers against a target of 50); by May 2026 the platform had 100+ onboarded suppliers, with ~80 running campaigns regularly.
- Designed the application architecture using FSD (Feature-Sliced Design); selected the tech stack.

- Built the testing pyramid (Vitest, Testing Library, jsdom, MSW); covered key product business scenarios with integration tests.
- Set up monitoring and observability: Sentry, OpenTelemetry.
- Led a frontend team of 2–3 developers within a 12-person product team: code reviews, task planning, technical roadmap, onboarding of new developers.

Stack: React 19, TypeScript, Vite, FSD, Zustand, TanStack Query, MUI, TanStack Table / Virtual, dnd-kit, React Hook Form, Vitest, MSW, OpenTelemetry, Sentry, Storybook

Frontend Developer / Frontend Lead — WMS Mobile (handheld terminals) Sep 2023 — Oct 2024

A mobile solution for handheld data-collection terminals running X5 warehouse processes. A business-critical system: an outage halts warehouse operations.

- Designed an architecture with a React-like development model for the Internet Explorer Mobile environment (ES3 standard): state management, a modular core for warehouse business scenarios, and background server synchronization.
- Implemented high-load processing of barcode-scanner data streams; a distribution-center shift runs 50–100 devices simultaneously.
- Brought the product to a pilot launch on the first warehouse in ~6 months; then rolled it out warehouse by warehouse, adapting to devices and processes (forklift-mounted terminals, Android handhelds, warehouse-specific functionality). Dozens of warehouses at the time of departure; the system now runs across the group's entire warehouse network.
- Led a frontend team of 4–6 developers (staff and outstaff): sprint task distribution, code quality and deadline control, onboarding of 5+ new developers, participation in writing technical specifications.
- Worked within a ~40-person product team in close collaboration with product management; participated in roadmap adjustments based on pilot results.

Stack: JavaScript (ES3), HTML, CSS

Frontend Developer — WMS Desktop Mar 2023 — Sep 2023

The company's flagship warehouse management system, integrated into X5's core logistics infrastructure.

- Developed new features and refactored existing functionality within a large product team.
- Participated in technical syncs and backlog decomposition.

Stack: React, Redux Toolkit, TypeScript, MUI

91 team Jun 2021 — Mar 2023

A web development company — product and outsourced projects.

Frontend Developer — Regional web portal, CMS, news aggregator Jun 2021 — Mar 2023

- Developed and launched multiple products — both within teams and as the sole frontend developer on a project.
- Built an MUI-based UI Kit that unified interfaces across several projects and accelerated development.
- Implemented complex interactive modules: mapping services (Mapbox), data visualization (ECharts), forms and business scenarios.
- Participated in tech stack selection, backlog planning, and task decomposition; supported and optimized existing systems.

Stack: React, TypeScript, MobX, Redux, Vite, GraphQL, mapbox-gl, ECharts, React Final Form, react-virtuoso

Major Auto Jul 2018 — Jun 2021

Internal website support at a major automotive holding.

Technical Support Team Lead Jul 2018 — Jun 2021

- Led a support department of 4–5 people from September 2019; joined as a line specialist.
- Website administration, code fixes (HTML, CSS, JS, PHP templates), email campaign layout and delivery, marketing and brand-management tasks.
